INTRODUCTION

This 1997 Annual Hydrologic Monitoring Report for the Intermountain Power Agency (IPA) Horse Canyon Mine, Carbon County, Utah, Permit No. ACT/007/013 is submitted to the Division for their records and as a reference document. This report has been divided into six sections including this introduction. Each of the sections, except the introduction, presents a brief discussion concerning the monitoring results from each sample site and the two UPDES discharge locations. Included with this report are appendices containing the laboratory and field data sheets (Appendix A) and bar graphs illustrating measured flow, conductivity, pH, and concentrations of TDS, total iron, and hardness (Appendix B).

- It is important to note that each surface and groundwater site was monitored on a quarterly basis, while the UPDES discharge points are monitored on a monthly basis.

Monitoring Site B-1

This site is located in Horse Canyon Creek downstream of the mine area. This site was visited quarterly. Surface water flow was not observed at this location in 1997.

Monitoring Site HC-1

This site is located upstream of the mine site area on Horse Canyon Creek. Flows varied between a high of 30 gpm in March and a low of 12 gpm in September. Iron (total) was not detected in any water sample. TDS concentration ranged from a low of 870 mg/l to a high of 1470 mg/l (Appendix B).

The pH of the water samples from HC-1 was measured in the field and had a range from nearly neutral at 7.32 in September to slightly alkaline at 7.64 in June. Conductivity was also measured in the field and had a range of a high of 1000 umhos/cm in September to a low of 275 umhos/cm in April.

Monitoring Site RF-1

This site is located upstream of the point where the Little Horse Canyon Road crosses the Right Fork of Horse Canyon. Flows varied between a high of 20 gpm in March and a low of 5 gpm in June. Iron (total) was noted in the April water sample at 10.4 mg/l. This concentration is likely the result of iron carried in the sediment load from spring snowmelt. TDS concentration ranged from a low of 650 mg/l to a high of 880 mg/l (Appendix B).

The pH of the water samples from RF-1 was measured in the field and had a range from nearly neutral at 7.27 to slightly alkaline at 8.15. Conductivity was also measured in the field and had a range of a high of 1100 umhos/cm to a low of 720 umhos/cm.

Monitoring Site RS-2

This monitoring site is Redden Spring. The spring discharges from a sandstone ledge in the bottom of the Right Hand Fork of Horse Canyon. Measured spring flows varied between a high of 12 gpm and a low of 10 gpm. Iron (total) was not detected in the water samples. Typical TDS concentrations for RS-2 samples ranged from 820 mg/l to 1570 mg/l. Hardness concentrations were typically between a low of 361 mg/l and 747 mg/l.

The pH of the water samples from RS-2 was measured in the field and had a range from nearly neutral at 6.3 to slightly alkaline at 7.56. Conductivity was also measured in the field and had a range of a high of 850 umhos/cm to a low of 450 umhos/cm.

UPDES Discharge Points 001A and 002A

Discharge point 001A is located at the outlet structure of Sediment Pond 1 and discharge point 002A is located at the outlet structure of Sedimentation Pond 2. No water was discharged at either point in 1997.
